

**News Release - January 2009 [Albuquerque, NM]**

**Holochip Corporation completes SBIR Phase I in support of development of micro-actuated optics for wide field-of-view imaging with random-access optical zoom capability for the Defense Advanced Research Projects Agency (DARPA).**

[Albuquerque, NM] — January 2007 — Holochip Corporation announced today that it has successfully completed Phase I of a project funded by the Defense Advanced Research Projects Agency (DARPA) to develop micro-actuated optics for wide field-of-view imaging with random-access optical zoom capability. Funding for this project was provided under the SBIR Program. For more information on this project and on micro-actuated optics for wide field-of-view imaging with random-access optical zoom capability please contact Dr. Robert Batchko, [rgb@holochip.com](mailto:rgb@holochip.com).

About Holochip Corporation

Holochip Corporation is the leading manufacturer variable-focal-length adaptive polymer lenses (APL's). The APL enables engineers, scientists and consumers with innovative solutions for manipulating light. Our durable, high optical quality and high precision APL's provide wide aperture and range of focal power range without having to change the lens location. More information on Holochip Corporation can be found at [www.holochip.com](http://www.holochip.com).
